ODD Protocol (ODD 2020): Sections Explained

1. Overview
Purpose and Patterns: why the model was built and which empirical/theoretical patterns it reproduces.
Entities, State Variables, and Scales: entities represented, their attributes, and temporal/spatial scales.
Process Overview and Scheduling: sequence and timing of processes during each simulation step.

2. Design Concepts
Basic Principles, Emergence, Adaptation, Objectives, Learning, Prediction, Sensing, Interaction, Stochasticity, Collectives, and Observation. These concepts explain why the model behaves as it does and how system-level dynamics emerge from local processes.

Basic Principles: theoretical foundations.
Emergence: system properties arising from interactions.
Adaptation: how agents respond to conditions.
Objectives: goals pursued by agents.
Learning: memory or learning mechanisms.
Prediction: anticipation of future states.
Sensing: information available to agents.
Interaction: effects between entities.
Stochasticity: random processes and variation.
Collectives: groups acting as units.
Observation: outputs recorded and analyzed.

3. Details
Initialization: starting conditions of the simulation.
Input Data: external datasets used during runs.
Submodels: equations, algorithms, and parameter descriptions underlying each process.
